

WorldEmergency Shelters

WorldEmergency is an emergency supplies manufacturer, supplying the needs of people worldwide from international government agencies, to corporations in the private sector and the general public.

We design and manufacture a variety of emergency kits for earthquakes, floods, fires, and civil unrest. One of our major premiere emergency kits is called "The House in a Bag" which has every thing you need for a family of four. This line of disaster kits comes standard with a deluxe family tent for shelter in case your home was destroyed. We also provide a premium heavy-duty family boat or life vests in case of major flooding, clothes to wear, a portable toilet, enough food and water for a family of four, and all other basic necessities in times of crises.

WorldEmergency also manufactures a complete line of portable emergency shelters such as homes, schools, offices, stores, an emergency hospital unit, and communication center unit. All these emergency facilities are designed and constructed from solid steel shipping of which we fashion into every desired facility that will be critical limits in a major disaster.

We design and manufacture a basic 40 feet high cube steel structure, cut out the windows and doors, place in the desired floorings such as hard wood oak floors or ceramic tile. We also design ceiling fan systems, and centralized air for cooling and heating, along with various ionized air filtration and cleaning systems; all this to make the environment inside your facility as comfortable as possible. Also, the water and power design within your facility is a solar and battery power system and that can provide you with all the energy you need to run all your lights, appliances, and other household and office equipments. This is our ESP (Energy Solar Power) Monolith System. We can provide all types of facilities whether it is a home, office, school, or hospital, we have the design facility that you need.

The reason we have designed the system inside the container is because it provides a wealth of benefits. First of all, it is solid steel and can withstand pressure of one million pounds. The unit is universally designed worldwide with international specifications which remains the same throughout the world. Therefore, it can fit a truck, train, and a boat, and therefore, its mobility is very versatile and can be transported throughout the world. Moreover, it can withstand an approximately 8.5 earthquake. The roof will virtually never collapse on your head because it is made of solid steel. It is the most portable facility system used today throughout the world.

This is how we manufacture all of our facilities and shelters, giving it the basic foundation structure of strength and mobility needed in an unstable world.

We can design any facility according to your specifications.
